

Calibrating a Smart Trainer

Calibrating a smart trainer ensures accurate power readings and consistent resistance during workouts. Most calibration issues stem from incomplete warmups, outdated software, unstable connections, or unrecognized sensors. Follow the steps below to resolve calibration problems.

Pre-Calibration Checklist

1. Confirm the smart trainer is powered on and connected to the app via Bluetooth or ANT+.
2. Verify the trainer's firmware is up to date.
3. Confirm the app and any companion apps are updated to the latest version.
4. Have the user check for nearby devices paired to the trainer and disconnect them.

Calibration Steps

1. Instruct the user to open the app's pairing or connections screen.
2. Confirm the trainer appears as both the power source and controllable device.
3. Select the trainer and choose the calibration or spindown option.
4. Instruct the user to follow the on-screen prompts:
 - Accelerate to the target speed shown in the app (typically 20-25 mph).
 - Stop pedaling when prompted and allow the flywheel to coast to a complete stop.
 - Wait for the calibration success confirmation (this may take 15-30 seconds).

If Calibration Fails

1. Have the user complete a 10-minute warmup ride and retry calibration.
2. Verify no other apps are connected to the trainer via Bluetooth.
3. Confirm the trainer is on a stable surface with no wheel slippage or movement.
4. If calibration continues to fail after completing the above steps, escalate to Tier 3 for technical review.

Troubleshooting Heart Rate Monitor (HRM) Pairing

Pairing a heart rate monitor allows users to record accurate BPM data during workouts and races. If an HRM fails to connect or disconnects mid-session, follow the steps below to verify setup and isolate the issue.

Initial Setup Verification

1. Confirm the HRM is powered on, worn with direct skin contact, and using a fresh battery.
2. If the strap uses conductive pads, have the user lightly moisten the sensors for better contact.
3. Verify Bluetooth or ANT+ is enabled on the user's device.

Pairing Process

1. Instruct the user to open the device pairing screen in the app.
2. Have the user select Heart Rate from the available pairing options.
 - If multiple HRMs appear, ensure the user selects the correct model.
3. Once paired, confirm the status indicator displays live BPM data.

If No BPM Data Appears

1. Have the user unpair the HRM and pair it again.
2. Instruct the user to restart the app and retry pairing.
3. Verify no other fitness apps are currently connected to the HRM.

If the issue persists

1. Have the user test the HRM in the manufacturer's app.
2. If the HRM also fails in the manufacturer's app, advise the user to contact the manufacturer for hardware support.
3. If the HRM works in the manufacturer's app but not in the fitness app, escalate to Tier 3 for technical review.
